

The Process

Air

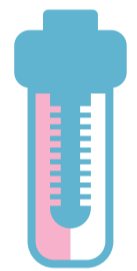

Air containing moisture is sucked into the unit by fans

5 MICRON SPUN

Cleanse

The water is run through a filter designed to pick up and remove big impurities like dirt, sand, mud and algae.

1 MICRON SPUN

Deep cleanse

The semi filtered water is then run through another filter to remove the even smaller particles.

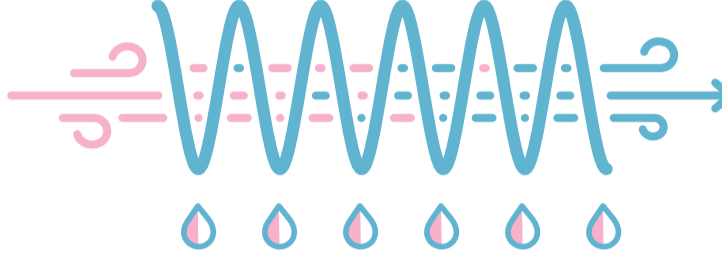

UV Sterilisation

Any remaining bacteria is sterilised by an internal UV light.

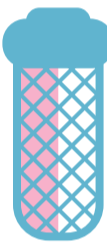

Polishing

This gives the water its good taste.

Condensation

the air meets coolant filled coils, which lowers the air's temperature - bringing it to "dew point".

Chemical removal

Here we remove all chlorine and chemicals from the water

99%
OF BACTERIA

Micro-extraction

This removes 99% of all invisible impurities including bacteria, viruses, heavy metals and excess minerals

Hot and cold refreshment

Finally the water is divided among three compartments; a stainless steel 18 litre tank, a 2 litre cold water tank and a 2 litre hot water tank. Enjoy clean, pure refreshment!
